

USER INTERFACE TECHNIQUE FOR SELECTION AND ACTIVATION OF  
WIRELESS SERVICES FROM AMONG MULTIPLE TRANSPORT CARRIERS

ABSTRACT

5

A method and device are provided for handling network  
activation between a computer and a carrier. In one example,  
the method involves receiving a command to initiate network  
activation procedures. The network activation status of the  
10 computer is then determined. If the computer is network  
enabled, a request is sent to a device having network  
activation information. The network activation information is  
received from the device. The computer is then configured  
with the network activation information in order to establish  
15 network activation with the carrier.
